

The graph above shows the actual ecological flow data-the amount of water left to the Paravani River from Paravani HEPP for February 2026.

The increased flow from 05 th and 06th February was due to seasonality effect, when the amount of water at intake was more than the Plant's capacity. On February 26, the water spill was caused by the emergency shutdown of the generator.

The minimum permitted ecological flow of Paravani HEPP is 1,75 m3/sec.
