

The graph above shows the actual ecological flow data-the amount of water left to the Paravani River from Paravani HEPP for June 2026.

During June, the increase in water flow through the riverbed was caused by the power generation limitations imposed by the electricity system dispatcher, as well as by seasonal conditions, during which the volume of water entering the intake exceeded the amount required for the hydroelectric power plant to operate at its maximum possible generation capacity.

The minimum permitted ecological flow of Paravani HEPP is 1,75 m³/sec.
